Q: MySQL VARCHAR NULL Count Returns 0 SELECT COUNT(*) FROM users WHERE username='someusername' AND password ='somepassword'; This query returns 0. I know that the username and password combination are correct because I use them elsewhere in the application without issue. I also know that the query returns the correct number of rows because the COUNT(*) works fine when I use it with an exact match. I'm sure the problem is related to something involving NULL values, but I'm not sure what I'm doing wrong. A: Try using IS NULL instead. SELECT COUNT(*) FROM users WHERE username IS NULL AND password ='somepassword'; If you want to count NULLs, change COUNT(*) to SUM(CASE WHEN field = NULL THEN 1 ELSE 0 END). A: You are using the same condition twice: username and password. So, because the second condition is based on the first condition, both will be true when the first one is true, so it will never count.
